EE 679 Computing Assignment 3

Name: Swrangsar Basumatary Roll: 09d07040

Question 1

Finding the narrowband spectrum of four syllables (pre-emphasized):

The functions:

```
function getNarrowbandSpectrum(inputFile)

[windowedSignal, fs] = getWindowedSignal(inputFile);
N = 2 ^ nextpow2(length(windowedSignal) * 4);

magnitudeSpectrum = 10* log10(abs(fft(windowedSignal, N)));
frequencyFactor = fs/length(magnitudeSpectrum);
magnitudeSpectrum =
magnitudeSpectrum(1:round(length(magnitudeSpectrum)/2));
w = (0:length(magnitudeSpectrum)-1) * frequencyFactor;

figure; plot(w, magnitudeSpectrum); axis tight;
title(['Short-term narrowband spectrum of ''', inputFile,
''''], ...
    'interpreter', 'none');
xlabel('Frequency in ''Hz''');
ylabel('Magnitude in ''dB''');

end

%% get hamming windowed central part of a signal

function [windowedSignal, fs] = getWindowedSignal(inputFile)

% inputFile = 'a_pani.wav';
windowDuration = 0.030; % in ms
[y, fs] = preEmphasize(inputFile);
siz = size(y);
length = siz(1);
centralIndex = round(length/2);
M = round(windowDuration * fs);
```

```
startIndex = round(centralIndex - M/2);
windowedSignal = y(startIndex:startIndex + M-1);
end
```

The script:

```
close all; clear all;

addpath /Users/swrangsarbasumatary/Desktop/
speechProcessingProject/

getNarrowbandSpectrum('a_pani.wav');
getNarrowbandSpectrum('n_pani.wav');
getNarrowbandSpectrum('i_pani.wav');
getNarrowbandSpectrum('s_uska.wav');

rmpath /Users/swrangsarbasumatary/Desktop/

The speech spectrum (in blue) follows the LPC spectrum (in green) closely. This means the ratio of their magnitudes lie close to 1 reducing the overall error to a minimum. The parts of the speech spectrum above the LPC spectrum contribute more to the error than the portions below (the valleys). For example l2-1l = 1 is greater than l1-(1/2)l = 1/2.

Answer to Q2(c)
